

Part 1:

| | |
|---------------------------------------------------------|---------------------------------------------------------------------|
| <code>pvcreate /dev/sda2 /dev/sda3</code> | <code>#create physical memories</code> |
| <code>vgcreate -s 16M vg1 /dev/sda2 /dev/sda3</code> | <code>#create volume group vg1 and set 16M extends</code> |
| <code>lvcreate -l 50 -n lvm02 /dev/vg1</code> | <code>#create a logical volume with 50 extends</code> |
| <code>mkfs -t ext4 /dev/vg1/lvm02</code> | <code>#create a new file system and make it ext4</code> |
| <code>mkdir -p /mnt/data</code> | <code>#create mounting directory</code> |
| <code>vim /etc/fstab</code> | <code>#open fstab file</code> |
| <code>/dev/vg1/lvm02 /mnt/data ext4 defaults 0 0</code> | <code>#assign lvm02 to be mounted automatically in #mnt/data</code> |
| <code>mount -a</code> | <code>#mount the mentioned volumes in the file</code> |

Part 2:

1+2)

| | |
|------------------------------------------------|-----------------------------------------------------------|
| <code>useradd user1</code> | <code>#create user1</code> |
| <code>passwd user1</code> | <code>#change password to redhat</code> |
| <code>vim /etc/ssh/sshd_config</code> | <code>#open sshd_config to remove user1 ssh access</code> |
| | <code>#add DenyUsers user1 line to the file</code> |
| <code>groupadd TrainingGroup</code> | <code>#create the group TrainingGroup</code> |
| <code>usermod -a -G TrainingGroup user1</code> | <code>#assign user1 to TrainingGroup group</code> |
| <code>usermod -u 601 user1</code> | <code>#change user1 id to 601</code> |
| <code>cat /etc/passwd less</code> | <code>#check changes</code> |
| <code>systemctl restart sshd</code> | <code>#restart ssh service to apply changes</code> |
| <code>ssh user1@172.20.30.30</code> | <code>#attempt ssh connection for user1</code> |
| | <code>#Permission denied, please try again.</code> |

3)

| | |
|----------------------------------------|------------------------------------------------------------|
| <code>useradd user2</code> | <code>#create user2</code> |
| <code>useradd user3</code> | <code>#create user3</code> |
| <code>groupadd admin</code> | <code>#create admin group</code> |
| <code>usermod -a -G admin user2</code> | <code>#assign user2 to admin group</code> |
| <code>usermod -a -G admin user3</code> | <code>#assign user3 to admin group</code> |
| <code>passwd user2</code> | <code>#change password to redhat</code> |
| <code>passwd user3</code> | <code>#change password to redhat</code> |
| <code>visudo</code> | <code>#open visudo file to change user3 permissions</code> |
| | <code>#add the line (user3 ALL=(ALL) ALL) to give</code> |
| | <code>#full root permissions</code> |

Part 3:

On machine 1:

| | |
|----------------------------------------|--------------------------------------------------|
| <code>ssh-keygen -t rsa</code> | <code>#generate ssh key</code> |
| <code>cat /root/.ssh/id_rsa.pub</code> | <code>#open id_rsa.pub to copy public key</code> |

On machine 2:

| | |
|--------------------------------|---------------------------------------------------------------|
| vim /root/.ssh/authorized_keys | #open authorized_keys file and paste the public #key in it |
|--------------------------------|---------------------------------------------------------------|

| | |
|--------------------------|-------------------------|
| ssh root@192.168.204.217 | #attempt ssh connection |
|--------------------------|-------------------------|

Part 4:

| | |
|---------------------------------------|-----------------------------------------|
| cp /etc/fstab /var/tmp/ | #copy file |
| mv /var/tmp/fstab /var/tmp/admin | #change file name to "admin" |
| setfacl -m u:user1:rwX /var/tmp/admin | #allow user1 to fully access the file |
| setfacl -m u:user2:--- /var/tmp/admin | #deny user2 from all access to the file |

Part 5:

| | |
|--------------|-------------------------------------|
| setenforce 1 | #make SELinux run in Enforcing mode |
|--------------|-------------------------------------|

Part 6:

| | |
|----------------|------------------------------------------------------------------------------|
| vim script.sh | #create a script file and fill it with a script that runs #for 10 minutes |
| sh script.sh & | #execute script in the background |
| ps | #check for the process id |
| kill 27525 | #kill the process using its id |
| ps | |

Part 7:

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| cd /var/www/html/pub/zabbixzone/6Server/x86_64/ | |
| wget -q -r -t1 --no-parent -nd --mirror https://repo.zabbix.com/zabbix/4.4/rhel/7/x86_64/ | #download all packages to local machine |
| mkdir -p /home/mypackage_dir/repository | #make directory for repository |
| cp * /home/mypackage_dir/repository | #copy all package files to the new directory |
| createrepo /home/mypackage_dir/repository/ | #create the repository |
| vi /etc/yum.repos.d/customrepo.repo | #create the repo file for the repository and fill it with #the following: |

```
[local]
name=My RPM System Package Repo
baseurl=file:///home/mypackage_dir/repository
enabled=1
gpgcheck=0
```

| | |
|-----------------------------------|-------------------------------|
| yum-config-manager --disable * | #disable all the repositories |
| yum-config-manager --enable local | #enable the new repository |
| yum install zabbix-web | #install the packages |
| yum install zabbix-server | |

```
yum install zabbix-agent
```

Part 8:

```
firewall-cmd --zone=public --add-port=80/tcp --permanent
#add port 80 and make changes permanent
firewall-cmd --zone=public --add-port=443/tcp --permanent
#add port 443 and make changes permanent
```

Part 9:

```
vim /home/cronscript.sh #create a script file and write a script that will output
# logged in users to a file
chmod +x /home/cronscript.sh #make the file executable
crontab -e #open the crontab scheduler and assign the file to
#execute at 1:30 AM
```

Part 10:

```
yum install mariadb-server #install the package
iptables -A INPUT -i eth0 -p tcp --dport 3306 -j ACCEPT
#add the port
iptables -A OUTPUT -p tcp -m tcp --dport 3306 -j ACCEPT
systemctl start mariadb.service #starting the service
systemctl enable mariadb.service #enabling the service
mysql -u root -p #connect to mariadb using 'root'
```

```
